Introduction

Some 2012 Camry vehicles may exhibit an intermittent shudder when lightly accelerating after an upshift around the following speeds: 26 mph (42 km/h) (4th), 36 mph (58 km/h) (5th) and/or 44 mph (71 km/h) (6th). Changes have been made in the torque converter assembly to reduce this condition. Refer to the repair procedure below for diagnostic instructions to confirm if the torque converter needs to be replaced to address this condition.

APPLICABLE WARRANTY

- This repair is covered under the Toyota Powertrain Warranty. This warranty is in effect for 60 months or 60,000 miles, whichever occurs first, from the vehicle’s in-service date.

- Warranty application is limited to occurrence of the specified condition described in this bulletin.

</tbody>
</table>

NOTE
Additional SSTs may be ordered by calling 1-800-933-8335.

* Essential SST.

Repair Procedure Overview

1. Verify the condition.
2. Confirm the condition is related to flex lock-up operation.
3. Perform three ATF drain, refill, and test drive operations to remove contaminated fluid and resolve the concern.
   • If the condition is resolved, no further action needed.
   • If the condition is still present, replace the torque converter assembly.

Repair Procedure

1. Connect Techstream to the vehicle and perform Health Check. Confirm NO DTC(s) are stored in the ECT or ECM (SAE term: Powertrain Control Module/PCM).

Are there any DTC(s) present in the ECT or ECM (PCM)?

• YES — This bulletin does NOT apply. Refer to the Technical Information System (TIS) and diagnose DTC(s).

• NO — Go to step 2.

2. Test drive the vehicle and confirm condition.
Torque Converter Shudder

Repair Procedure (Continued)

3. Use Techstream to take a snapshot when shudder is occurring to determine if it is occurring during flex lockup.

   Configure snapshot as follows:
   - All Data
   - 30 Second Duration
   - Trigger Point at Midpoint (50%)

   NOTE
   Refer to the University of Toyota online training class P901C “Techstream InDepth” for information about taking snapshots and graphing snapshots on Techstream.

4. Use Data List and the graphing functions of the Snapshot feature to confirm the following data parameters when the shudder condition occurs:
   - Vehicle Speed
   - Shift Status
   - Lock Up
   - SLU Solenoid Status
   - Throttle Sensor Volt %
Torque Converter Shudder

Repair Procedure (Continued)

Figure 2. Techstream Snapshot of Shudder Occurring During Flex Lockup

- If the shudder occurs with the following parameters:
  - Lock Up “OFF”
  - SLU Solenoid Status “ON”
Then the shudder is related to torque converter flex lockup. Go to step 5.

- If the shudder occurs with the following parameters:
  - Lock Up “OFF”
  - SLU Solenoid Status “OFF”
Then the condition is **NOT** related to torque converter flex lockup and this bulletin **DOES NOT APPLY.**

Continue diagnosis to identify the root cause for this shudder.
5. Replace the automatic transaxle fluid to remove possible contamination.

A. Lift the vehicle.

**NOTICE**
Set the vehicle on a lift so that the vehicle is kept level when it is lifted up (make sure that the tilt angle from the front to rear of the vehicle is within +/- 1°).

B. Remove the front wheel opening extension pad LH, engine under cover LH and front fender apron seal LH.

C. Remove the refill plug and gasket from the automatic transaxle.

D. Using a 6 mm hexagon socket wrench, remove the overflow plug and gasket from the automatic transaxle.

**CAUTION**
Automatic transaxle fluid may be hot if the vehicle was not allowed to cool prior to draining the fluid.
E. Using a 6 mm hexagon socket wrench, remove the No. 1 transmission oil filler tube from the oil pan and drain the automatic transaxle fluid.

F. Measure the amount of fluid that you drained.

HINT
Add the same amount of fluid in step I.
Repair Procedure (Continued)

G. Using a 6 mm hexagon socket wrench, install the No. 1 transmission oil filler tube to the oil pan.
   Torque: 1.7 N*m (17 kgf*cm, 15 in*lbf)

H. Temporarily install the gasket and the overflow plug.

   **HINT**
   Reuse the old gasket. The plug will be removed again to adjust the fluid level.

I. Add fluid to the refill hole using the same amount of fluid drained in step F.

   **NOTICE**
   Use Toyota Genuine ATF WS.
Repair Procedure (Continued)

J. Temporarily install the gasket and refill plug to avoid fluid spillage.

**HINT**

Reuse the old gasket. The plug will be removed again to adjust the fluid level.

K. Lower the vehicle.

L. Start the engine.

M. Slowly move the shift lever from P to D, and then back to P.

N. Allow the engine to idle for 30 seconds to warm it up.

O. Turn the engine switch off.

P. Adjust fluid temperature, then adjust fluid level.

Refer to the Technical Information System (TIS), applicable model and model year Repair Manual:

* 2012 Camry:

6. Test drive the vehicle until the A/T oil temperature has reached and maintained 160°F (71°C) for at least 10 minutes.

7. Repeat steps 5 and 6 two more times.

**HINT**

Only replace the refill and overflow plug gaskets with new ones on the 3rd fluid adjustment procedure.

8. Perform a leak check and reassembly.

   A. Lift the vehicle.

   B. Clean each part.
Repair Procedure (Continued)

C. Check for fluid leaks.

D. Install the front wheel opening extension pad LH, engine under covers LH and front fender apron seal LH.

E. Lower the vehicle.

9. Is the shudder concern resolved?
   • **YES** — The repair is completed.
   • **NO** — Go to step 10.

10. Replace the torque converter.

Refer to TIS, applicable model and model year Repair Manual:
   • 2012 Camry:
     

11. Adjust the transmission fluid level in the transmission.

   **NOTICE**
   Failure to use WS transmission fluid and to properly adjust transmission fluid level can cause transmission shifting issues, MIL “ON”, and/or transmission damage.

Refer to TIS, applicable model and model year Repair Manual:
   • 2012 Camry:
     

12. Test drive the vehicle and confirm the shudder condition is eliminated.
